

INVESTOR OVERVIEW

ORBIC

The Intelligent Operating System for Retail Energy Providers

Sales · Operations · Portfolio · Collections — one connected platform

Retail energy providers run on disconnected systems

Different tools. Different spreadsheets. No shared source of truth.

When these functions don't talk to each other, every handoff is a place errors get in:

- Margin loss — pricing and hedging decisions made without a live view of enrolled load or settlement risk
- Compliance exposure — PUC deadlines, tax rules, and audit trails tracked manually across disconnected files
- Customer-facing errors — enrollment delays, billing mistakes, and meter mix-ups that reach the customer
- Operational cost — headcount spent reconciling spreadsheets instead of running the business

One platform. Four connected operating engines.

The complete REP lifecycle, on one data model

Every stage writes to the same underlying data model — a single source of truth end to end

Sales Engine

Daily & Custom Pricing

Daily pricing generation and custom quote workflows in the core application, covering the pricing screens sales teams use every day.

BUILT

Broker Management

Broker directory, ESI ID lookup, and commission tracking inside the core app.

BUILT

Broker Portal & Application

Standalone Orbic Broker Portal — real login, live renewal/expiration dashboard, and 13 PDF-generation forms (contracts, LOA, ACH, credit card, guarantee, credit check, account transfer, cancellation, meter add-on, payment plan).

BUILT

Contract Management

Contract tracking with expiring-contract alerts at 30- and 90-day horizons pulled from live renewal data.

BUILT

Commission Management

Commission calculation and downloadable commission reports for brokers.

BUILT

Broker-Facing Quote Pricing Engine

Automated daily-quote and custom-price generation directly inside the Broker Portal — the portal's own pricing endpoints are stubs today.

ROADMAP

Operations Engine

Contract Confirmation

Confirmation workflow that hands a signed offer into the enrollment pipeline.

BUILT

Enrollment & MasterRoll

Enrollment Engine supports six contract types and generates the 128-column MasterRoll XLSX used for ERCOT switch submission, with active-contract guard rules.

BUILT

Activation

Activation writes contract_renewal as the single source of truth for an active contract.

BUILT

Billing Engine

Ingests EDI 867/810, matches contracts, computes tax, and produces invoices.

BUILT

Multi-Meter Portal — Continuous Move-In / Move-Out

Standalone app, own DB and JWT auth. Customers add, cancel, and confirm meters on an ongoing self-service basis — that workflow is the continuous move-in/move-out operation, with unit-number-aware records for multi-meter properties.

BUILT

Payments

Payment processing surfaces exist in the app but are marked upcoming in the product navigation itself.

ROADMAP

Portfolio and Risk Engine

ERCOT Price Forecasting

A DAM price-distribution model layered on the existing load and weather forecasting engines.

DAM/RTM Hedging Framework

A risk-gated framework for the residual real-time exposure that remains after day-ahead procurement.

Backtested Performance

Quantitative validation is planned once the price forecasting model and hedging framework are built — no results exist yet.

ROADMAP

No backtest has been run — this slide is a placeholder for real results, not an estimate.

- Cost savings versus a naive always-100%-DAM-hedge baseline, once the price forecasting model exists
- Risk-containment metrics — RTM exposure avoided in high-risk hours, spike-hour outcomes
- No cost-savings figures, accuracy percentages, or risk metrics are presented anywhere in this deck until they come from an actual backtest against historical ERCOT data

Shadow Settlements

A four-step reconciliation workflow that checks ORBIC's own billing math — energy and ancillary service costs — against ERCOT's settlement of record.

Foundation already in place: ERCOT settlement data ingestion (RTM Initial / Final / True-Up) feeds the Position Screen today

Collections Engine

A full delinquency lifecycle with PUC-compliant notice timing and a human-approval gate on every irreversible action.

AI Operating Layer

In the app today

- Orbi is a live, tool-calling agent wired to 12 real ORBIC endpoints
- Answers are grounded in production data — no invented figures
- Runs inside the core app end users already use

Built, not yet merged

- A separate operational email assistant (next slide) — built and tested standalone; integrating it into the main app is what remains
- Grounded in 15 years of founder-provided REP email correspondence — a real dataset, not an independently verified performance claim

Operational Email Assistant

A working retrieval + drafting pipeline for inbound operational email — built and tested outside the main app, not yet merged into it.

Box shapes are a structural reference — the real pipeline drafts replies via local retrieval over historical email, gated by a confidence check

Audit and Control Layer

Enrollment Audit

Dedicated enrollment-audit screen and workflow in the core application.

BUILT

Billing Audit

Dedicated billing-audit screen checking invoices against contract and usage data.

BUILT

Payment Audit

Dedicated payment-audit screen reconciling payments against billed amounts.

BUILT

Tax & Process Audit Trail

Tax computation (SPD3 / MGRT / PUCA) runs inside the Billing Engine with a traceable calculation path per invoice.

BUILT

Commission Audit

A dedicated commission-audit view beyond the existing commission report is not yet a separate product surface.

ROADMAP

Forecast Monitoring Checkpoints

Four automated nightly checkpoints (Mirror Test, Historical Backtest, Energy Balance Sanity, Portfolio Ratio Check) that self-check the forecast pipeline.

BUILT

Reporting and Intelligence Layer

IN PROGRESS

Report-generation module is structured and in progress — it is flagged directly in the product's own navigation as an upcoming feature.

A large, underserved long tail of small-to-mid REPs

140

PUCT-certified REPs operating in ERCOT today

63–78%

of Texas residential share held by just the top 3 incumbents — everyone else is long tail

13 states + DC

have residential retail choice nationally — ERCOT is the beachhead, not the ceiling

ORBIC Pricing — Target Segment: REPs with 0–50k Meters

Under 10,000 meters

\$2.50 / meter / month

10,000+ meters

\$2.00 / meter / month

→ \$150K–\$1.2M ARR per REP across the 5k–50k meter target range

Illustrative, based on ORBIC's own stated pricing — not a market-size figure.

Full-stack platforms are arriving — none built for the small/mid REP

VertexOne / VXretail

CIS & billing incumbent — 400+ cloud customers; named live ERCOT REP customers (Graviti Power, Gridmatic Retail, Summer Energy Northeast).

Gap for ORBIC: Billing/CIS only — no integrated portfolio, risk, or AI layer.

Kraken Technologies (Octopus Energy)

Global full-stack platform — signed a 5-year deal with Champion Energy Services (2025) to bring Kraken into Texas residential.

Gap for ORBIC: Entering via one large enterprise account — not priced or built for the 0–50k meter segment.

Ascend Analytics / Enverus / ZE PowerGroup

ETRM and risk-analytics point solutions — hedging, forecasting, and trading analytics only.

Gap for ORBIC: No CIS, billing, or collections — REPs must stitch these together with a separate billing vendor.

ORBIC: full-stack like Kraken, sized and priced for the small/mid REP segment VertexOne serves piecemeal and Kraken hasn't chased.

Proven in production. Focused on the segment incumbents ignore.

Track Record

15 years running a real, operating ERCOT REP's full stack — proven in production, not a prototype.

Target Segment

REPs with 0–50k meters — below the scale where incumbents build in-house, below where enterprise CIS vendors focus.

Direct Sales

Outbound to REP ops, finance, and executive leadership — the buyers who feel disconnected systems every day.

Broker Channel

The built Broker Portal already gives brokers — who touch multiple REPs at once — a reason to be in the platform, creating a channel into their REP relationships.

Usage-based pricing (\$2.00–\$2.50 / meter / month) lowers the barrier to a pilot versus a multi-year enterprise CIS contract.

Defensibility

- **Integrated, not stitched together**

Sales, enrollment, billing, portfolio, and collections read and write the same underlying data model — contract_renewal is the single source of truth from activation through billing.

- **Domain-specific operational rules encoded in the product**

PUC's 10-day DNP notice rule is enforced in code before an execution path is even reachable, not left to a spreadsheet or a person's memory.

- **Cross-engine intelligence**

The Risk Dashboard's Customer factor queries the Collections module directly — portfolio risk scoring is informed by real receivables exposure, not a static estimate.

- **Audit checkpoints built into daily operation**

Four nightly self-checks on the forecast pipeline itself, plus dedicated enrollment, billing, and payment audit screens.

- **AI grounded in operational workflows**

Orbi is wired to real production endpoints with an explicit no-invented-data grounding rule, not a generic chatbot layered on top.

- **Distinct, purpose-built products for hard sub-problems**

The Broker Portal and the Multi-Meter Portal are standalone applications solving broker paperwork and multi-meter management specifically — not generic screens repurposed for the job.

Product Maturity

Sales capabilities (pricing, contracts, commission)	BUILT	Shadow Settlements (estimate → compare → reconcile → audit)	IN PROGRESS
Broker Portal & application	BUILT	Collections Agent (autonomous LLM actor)	ROADMAP
Enrollment Engine & MasterRoll	BUILT	Operational email assistant (standalone pipeline)	PARTIALLY BUILT
Multi-Meter Portal	BUILT	Operational email assistant — merged into ORBIC	ROADMAP
Billing Engine (EDI ingestion → tax → invoice)	BUILT	Report generation & library	IN PROGRESS
Portfolio forecasting (DNA / growth / LFC layers)	BUILT	Seasonal NOAA forecast layer	ROADMAP
7-Day LFC override	BUILT	Live MTM market-price feeds	ROADMAP
Monitoring checkpoints (4 nightly checks)	BUILT	ERCOT MIS / SMT automation	ROADMAP
Manual mark-to-market	BUILT		

VISION

ORBIC becomes the operating layer for retail energy providers

- Daily decision support across sales, operations, portfolio, and collections
- Deeper audit and forecasting intelligence built directly into the platform
- Settlement intelligence that closes the loop between billing and ERCOT settlement
- A collections lifecycle that scales without scaling headcount
- AI-assisted operations grounded in the same data the business runs on
